# WPC

Wood-Plastic Composites (WPC) is a new type of

composite material that has flourished at home and abroad in recent years. It refers to the use of polyethylene, polypropylene and polyvinyl chloride, etc.: instead of the usual resin adhesives, with more than 50 , The above wood flour, rice husks, straw and other waste plant fibers are mixed into new wood materials, and then processed by extrusion, molding, injection molding and other plastic processing techniques to produce a kind of n-season master. Yiduo ".I.T flow packaging and other industries. The plastic and wood powder are mixed in a certain proportion and then hot-extruded to form the board, which is called extruded wood-plastic composite board.

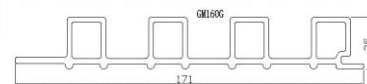

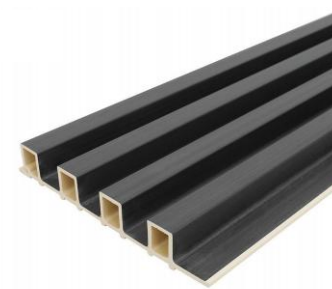

The wood-plastic composite material contains plastic, so it has a good elastic modulus. In addition, because it contains fibers and is fully mixed with plastic, it has the same mechanical pressure as hardwood, and its usability is obviously better than that of ordinary wood materials. The surface hardness is high, generally 2-5 times that of wood.
